

Germinating a Seed

You will need:

- A sealable plastic bag
- A moist napkin
- Some seeds

Instructions:

1. First, check to see if your seeds are viable (capable of growing). You can test this by placing your seeds in a container of water and let sit for 15 minutes. If the seeds sink, they are still viable. If they float, they most likely will not sprout.
2. Take the seeds that did not float and place on the moist napkin. Fold the napkin over the seed so that the seed has moisture on both sides.
3. Slide the folded napkin with the seed inside into your plastic bag and seal it.
4. Put the plastic bag on a windowsill and watch for your seeds to sprout!
